### **DETAILED ACTION**

Applicants amendment of claim 71, Paper of 4/6/2004, is acknowledged.

Applicants' arguments filed on 4/6/2004 have been fully considered and are deemed to be persuasive to overcome some of the rejections previously applied. Rejections and/or objections not reiterated from previous office actions are hereby withdrawn. Claims 71 and 72 are still at issue and are present for examination.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 71 and 72 are rejected under 35 U.S.C. 102(e) as being anticipated by Pecker et al. (U.S. Patent No. 5,968,822).

Pecker et al. teach a polynucleotide encoding a human heparanase polypeptide. Pecker et al. further teach the infection of High Five or Sf21 cells with pFhpa virus and the expression of the encoded mammalian heparanase. Pecker et al. further teach that upon expression of the encoded mammalian heparanase, by the High Five or Sf21 cells the heparanase is excreted into the medium, as demonstrated by the ability of the

Art Unit: 1652

culture medium to produce low molecular weight HS degradation fragments upon incubation of the medium with sulfate-labeled ECM. Thus an inherent property of the insect cultures expressing the taught recombinant mammalian heparanase as taught by Pecker et al. is that the the excreted heparanase would externally adhere to said cells, thereby increasing the natural amount of heparanase externally adhered to said cells, so as to enhance extravasation, implantation, transplantation, invasion and/or migration of said cells in vivo. Further these cells are genetically modified cells. Thus Pecker et al. anticipate claims 71 and 72.
